COSTFUNCTION

# AI Vision Integration

## Cost & Quality Assessment

---

6 images x 5 models · \$0.00032 – \$0.01227 per analysis

01

# Executive Summary

## RECOMMENDED MODEL

### Meta - Llama 3.2 90B Vision Instruct

#### COST RANGE

**\$0.00032 –  
\$0.01227**

#### SAVINGS

**97%**

#### ANALYSES

**30**

#### AVG LATENCY

**3.3s**

## Assessment Overview

This assessment evaluated **5 AI vision models** across 6 images, producing 30 independent analyses. All models received identical images under standardized parameters — same prompt, same temperature, same preprocessing — isolating model capability as the sole variable.

## Key Findings

**Meta - Llama 3.2 90B Vision Instruct** emerged as the recommended model with an overall score of 100 based on your stated priorities of Cost 34%, Quality 33%, Speed 33%. The nearest competitor, Anthropic Claude - Claude Haiku 4.5, scored 85 overall.

- **Cost:** Per-image costs range from \$0.00032 (Meta - Llama 3.2 90B Vision Instruct) to \$0.01227 (Google Gemini - Gemini 3.1 Pro Preview), a 38.2x spread. Meta - Llama 3.2 90B Vision Instruct costs \$0.00032 per image, 97% less than the most expensive alternative.
- **Quality:** Meta - Llama 3.2 90B Vision Instruct achieved a quality score of 100 versus Anthropic Claude - Claude Haiku 4.5 at 95. Output quality was assessed on technical accuracy, element detection, and commercial viability of the analysis.
- **Speed:** Meta - Llama 3.2 90B Vision Instruct averaged 3.3s per analysis. At scale, latency differences compound into meaningful throughput gaps.

## Bottom Line

Adopting **Meta - Llama 3.2 90B Vision Instruct** at current volumes yields a per-image cost of \$0.00032, representing 97% savings versus the highest-cost alternative. At 10,000 images per month, this translates to \$3.21 in monthly spend. The detailed model comparison, cost projections, and recommendation rationale follow in subsequent sections.

## Priority Weights

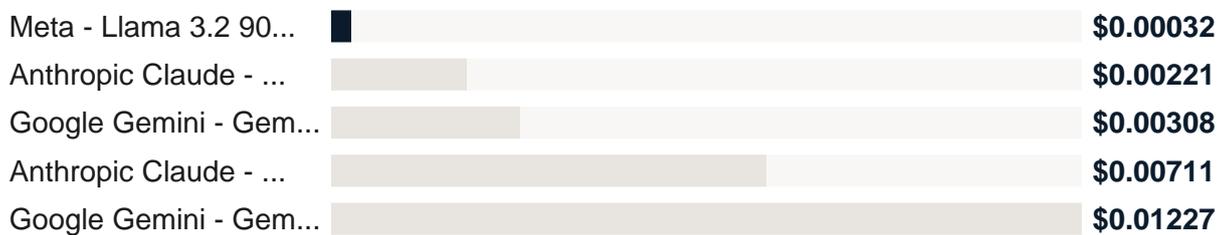

*All models received identical images under standardized parameters. Scores reflect weighted composite of cost efficiency, output quality, and response speed. See Appendix A for full methodology.*

02

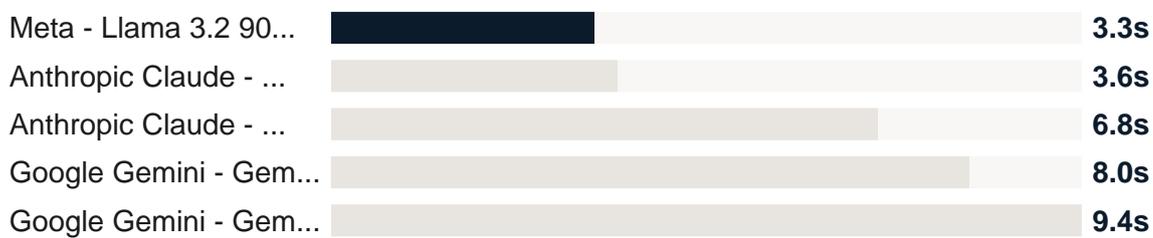

# Model Comparison

MODEL	OVERALL	COST	QUALITY	SPEED
<b>Meta - Llama 3.2 90B Vision I... <small>REC</small></b>	<b>100</b>	100	100	100
Anthropic Claude - Claude Hai...	85	86	95	92
Anthropic Claude - Claude Son...	69	45	98	48
Google Gemini - Gemini 3 Flash	60	10	90	41
Google Gemini - Gemini 3.1 Pr...	47	4	85	35

## Cost per Image

## Average Latency

## Model Consensus

**Agreement Score:**  **88%**

All models demonstrate strong agreement on the core content analysis, correctly identifying the NASA Apollo mission support equipment, weathered metal surface, and vintage nature of the asset. They consistently classify it as a photograph, provide similar technical quality scores (7-8 range), and identify comparable elements including the NASA logo, stenciled text, and manufacturing dates. The models show remarkable consistency in safety assessments (all flagged as safe) and generate overlapping commercial tags focused on space, vintage, NASA, and historical themes.

## Key Differences

- Description verbosity varies significantly: Gemini models provide more elaborate summaries with detailed contextual information, while Llama and Claude models offer more concise technical descriptions
- Date interpretation shows minor discrepancies: some models identify 'February 1966' while others note '1969', suggesting different text elements were emphasized in the weathered surface
- Complexity scores range from 4-6, reflecting different interpretations of visual density versus subject simplicity in the close-up composition
- Commercial tag selection differs in specificity: some models emphasize emotional tags like 'nostalgia' and 'heritage' while others focus more on literal descriptors like 'corrugated metal' and 'industrial'

## 03

## Cost Projections

The following projections estimate total cost at various monthly volumes, based on observed per-image costs during this assessment. All figures assume consistent image complexity and model pricing.

MODEL	100	500	1K	5K	10K	50K	100K
<b>Meta - Llama 3.2 90B Vision Instruct</b>	<b>\$0.03208</b>	<b>\$0.16042</b>	<b>\$0.32083</b>	<b>\$1.60</b>	<b>\$3.21</b>	<b>\$16.04</b>	<b>\$32.08</b>
Anthropic Claud...	\$0.22145	\$1.11	\$2.21	\$11.07	\$22.14	\$110.72	\$221.45
Google Gemini -...	\$0.30820	\$1.54	\$3.08	\$15.41	\$30.82	\$154.10	\$308.20
Anthropic Claud...	\$0.71085	\$3.55	\$7.11	\$35.54	\$71.09	\$355.43	\$710.85
Google Gemini -...	\$1.23	\$6.13	\$12.27	\$61.34	\$122.67	\$613.35	\$1226.70

At 10,000 images/month, adopting **Meta - Llama 3.2 90B Vision Instruct** saves **\$119.46/month** versus the highest-cost alternative — **\$1433.54 in annual savings**.

## Strategic Considerations

### Volume Discounts

Several providers offer tiered pricing at higher volumes. Actual costs at 50K+ images may be lower than linear projections shown.

### Quality Trade-offs

The cheapest model is not always the best value. Factor in output quality scores when evaluating total cost of ownership.

### Latency at Scale

High-volume workloads may benefit from faster models despite higher per-image cost, reducing total processing time.

### Multi-Model Strategy

Consider routing simple images to a cheaper model and complex ones to a premium model for optimal cost-quality balance.

04

# Recommendation

## Assessment Rationale

Meta's Llama 3.2 90B Vision Instruct emerges as the clear winner with an overall score of 100, excelling across all three dimensions that matter to the user. It delivers the fastest response time at 3289ms, costs dramatically less at \$0.000321 per image (38x cheaper than the most expensive option), and produces high-quality, well-structured JSON responses that fully satisfy the prompt requirements. Given the user's balanced priorities (34% cost, 33% quality, 33% speed), this model represents the optimal choice without requiring any trade-offs. The responses demonstrate strong technical analysis with appropriate scoring, comprehensive element detection, and accurate asset classification. While Gemini models provide slightly more verbose descriptions, the Llama model's concise yet complete responses are perfectly adequate for the technical assessment task. Claude Haiku 4.5 comes in second place with strong performance across metrics, but cannot match Llama's exceptional cost efficiency. For users who prioritize absolute maximum detail in descriptions or need the most sophisticated reasoning capabilities, Claude Sonnet 4.6 or Gemini 3.1 Pro Preview might be worth the 13-38x cost premium, but for this balanced use case, Llama 3.2 90B delivers unbeatable value.

## Key Differentiators

### 1 Overall Score Leadership

Meta - Llama 3.2 90B Vision Instruct achieved an overall score of 100, reflecting the best weighted balance of cost (34%), quality (33%), and speed (33%).

### 2 Cost Efficiency

Cost score of 100 vs. runner-up Anthropic Claude - Claude Haiku 4.5 at 86. At scale, cost differences compound significantly.

### 3 Quality vs. Speed Balance

Quality score of 100, speed score of 100. This combination ensures production-ready output without latency bottlenecks.

## RECOMMENDED NEXT STEPS

- 1. Validate** — Run a pilot with Meta - Llama 3.2 90B Vision Instruct on your production image set to confirm quality meets your specific standards.
- 2. Integrate** — Configure your pipeline with the recommended model. Implement error handling and fallback to a secondary model if needed.
- 3. Optimize** — Monitor actual costs at volume. Re-evaluate quarterly as model pricing and capabilities evolve rapidly.

### Observation

Meta - Llama 3.2 90B Vision Instruct produced this analysis at \$0.00032 in 3.6s while costing \$0.00511 less per image. This pattern was consistent across the full image set. See Appendix B for all image results.

## APPENDIX A

# Methodology & Disclaimers

---

## Standardized Test Conditions

All 5 models received identical images under standardized parameters, isolating model capability as the sole variable. Each model processed the same 6 images, producing 30 independent analyses. Prompt content, temperature settings, and image preprocessing were held constant across all providers to ensure direct comparability.

## Scoring Methodology

Overall scores reflect a weighted composite of three dimensions: cost efficiency, output quality, and response speed. Weights are configured by the user based on their stated priorities. Individual dimension scores are normalized to a 0–100 scale using min-max normalization across all tested models. The recommended model represents the highest weighted composite score, not necessarily the best performer in any single dimension.

## Cost Basis

Per-image costs are calculated from actual API token consumption during the assessment. Input tokens (image encoding + prompt) and output tokens (model response) are tracked per call. Costs use each provider's published pricing at the time of analysis. Volume projections assume linear scaling; actual costs at higher volumes may differ due to provider-specific tiered pricing, batching discounts, or negotiated enterprise rates.

## Limitations

This assessment reflects model performance at a specific point in time. AI model capabilities, pricing, and availability change frequently. Results are specific to the images and prompt used in this assessment; different image types or analysis requirements may yield different relative rankings. This report does not constitute a guarantee of future model performance or pricing. We recommend periodic re-evaluation, particularly before major procurement decisions.

Respectfully submitted,

**Troy Hicks**
